Time-Date and text manipulation in R

Surya Lamichhane

17 January 2024

Contents

Learning Objectives By the end of this lesson, you will be able to:

- Understand structure of time and date in R
- Manipulate time and date in R
- Manipulate strings in R

Time and date manupulation in R

data and time in R

```
Sys.Date()
```

```
## [1] "2024-01-17"
```

```
Sys.time()
```

```
## [1] "2024-01-17 21:34:28 CST"
```

```
Sys.timezone()
```

```
## [1] "America/Chicago"
```

Using library lubridate

```
library(lubridate)
```

```
##
## Attaching package: 'lubridate'
```

```
## The following objects are masked from 'package:base':
##
##     date, intersect, setdiff, union
```

```
now()
```

```
## [1] "2024-01-17 21:34:28 CST"
```

```
today()
```

```
## [1] "2024-01-17"
```

Creating date/times

There are three types of date/time data that refer to an instant in time:

- date: of type
- time: of type
- date-time: of type , it uniquely identifies an instant in time

In most cases, we create a date/time in three ways:

- a string.
- an individual date-time components.
- an existing date/time object.

```

ymd("2023-01-30")
```

Using a string

```
## [1] "2023-01-30"
```

```
mdy("January 30, 2023")
```

```
## [1] "2023-01-30"
```

```
mdy("January 31st, 2023")
```

```
## [1] "2023-01-31"
```

```
dmy("30-Jan-2023")
```

```
## [1] "2023-01-30"
```

- date-time from a date by supplying a timezone:

```r
#Coordinated Universal Time (UTC)
ymd(20230131, tz = "UTC")
```

```
## [1] "2023-01-31 UTC"
```

Example (New York flight data from R package nycflights13")

```r
#install.packages("nycflights13")
library(nycflights13) #TO GET THE FILEGT DATA
library(dplyr)
str(flights)
```

```
## tibble [336,776 x 19] (S3: tbl_df/tbl/data.frame)
##  $ year          : int [1:336776] 2013 2013 2013 2013 2013 2013 2013 2013 2013 2013 ...

## # i 3 more variables: arr_time <dttm>, sched_arr_time <dttm>, air_time <dbl>
```

- Find arrival delay and departure delay

```
flights_dt %>%
  select(origin,dest,arr_time,sched_arr_time,dep_time,sched_dep_time ) %>%
  mutate(arr_delay1 = (arr_time - sched_arr_time), dep_delay1 = (dep_time - sched_dep_time)) %>%
  select(origin,dest,arr_delay1,dep_delay1)  %>%
  head()
```

```
## # A tibble: 6 x 4
##   origin dest  arr_delay1 dep_delay1
##   <chr>  <chr> <drtn>     <drtn>
## 1 EWR    IAH     660 secs   120 secs
## 2 LGA    IAH    1200 secs   240 secs
## 3 JFK    MIA    4380 secs   120 secs
## 4 JFK    BQN   -1080 secs   -60 secs
## 5 LGA    ATL   -1500 secs -2760 secs
## 6 EWR    ORD     720 secs  -240 secs
```

Exercise 1. Compute the number of flight that are arrived late at least 30 minutes

```
flights_dt %>%
  select(origin,dest,arr_delay) %>%
  filter(arr_delay > 30) %>%
  head()
```

```
## # A tibble: 6 x 3
##   origin dest  arr_delay
##   <chr>  <chr>     <dbl>
## 1 JFK    MIA          33
## 2 LGA    DFW          31
## 3 EWR    ORD          32
## 4 LGA    DFW          48
## 5 JFK    LAX          44
## 6 LGA    DFW          31
```

Exercise 2. What origin has most arrival delay?

```
flights_dt %>%
  select(origin,arr_delay) %>%
  group_by(origin) %>%
  arrange(desc(arr_delay)) %>%
  head()
```

```
## # A tibble: 6 x 2
## # Groups:   origin [2]
##   origin arr_delay
##   <chr>      <dbl>
## 1 JFK         1272
## 2 JFK         1127
## 3 EWR         1109
## 4 JFK         1007
## 5 JFK          989
## 6 JFK          931
```

Exercise 2. Compute the the destinations that have most departure delays.

```
flights_dt %>%
  select(dest,dep_delay) %>%
  group_by(dest) %>%
  arrange(desc(dep_delay))%>%
  head()
```

```
## # A tibble: 6 x 2

## 3 ORD        1126
## 4 SFO        1014
## 5 CVG        1005
## 6 TPA         960
```

String Manipulation in R using *stringr* package

```
string <- "Hi, how are you doing?"
vector_of_strings <- c("Hi, how are you doing?", "I'm doing well, HBY?", "Me too, thanks for asking.")
```

```
cat("number of characters in string:", nchar(string), "\n")
```

```
## number of characters in string: 22
```

```
cat("number of characters in vector_of_strings:", nchar(vector_of_strings))
```

```
## number of characters in vector_of_strings: 22 20 26
```

```
library(stringr)
str_to_lower(vector_of_strings)
```

```
## [1] "hi, how are you doing?"     "i'm doing well, hby?"
## [3] "me too, thanks for asking."
```

```
str_to_upper(vector_of_strings)
```

```
## [1] "HI, HOW ARE YOU DOING?"     "I'M DOING WELL, HBY?"
## [3] "ME TOO, THANKS FOR ASKING."
```

```
str_to_title(vector_of_strings)
```

```
## [1] "Hi, How Are You Doing?"     "I'm Doing Well, Hby?"
## [3] "Me Too, Thanks For Asking."
```

```r
str_to_sentence(vector_of_strings)
```

```
## [1] "Hi, how are you doing?"     "I'm doing well, hby?"
## [3] "Me too, thanks for asking."
```

```r
str_length(vector_of_strings)
```

```
## [1] 22 20 26
```

```r
str_sub(vector_of_strings, start = 1, end =4) # extracting first to fifth character
```

Extracting particular characters

```
## [1] "Hi, " "I'm " "Me t"
```

```r
str_sub(vector_of_strings, start = -5, end = -1) # extracting fifth-to-last to last character
```

```
## [1] "oing?" " HBY?" "king."
```

```r
str_sub(vector_of_strings, start = -1) <- "!"
vector_of_strings
```

Add a character

```
## [1] "Hi, how are you doing!"     "I'm doing well, HBY!"
## [3] "Me too, thanks for asking!"
```

```r
paste(vector_of_strings , "!", sep = '')
```

```
## [1] "Hi, how are you doing!!"     "I'm doing well, HBY!!"
## [3] "Me too, thanks for asking!!"
```

```r
vector_of_strings
```

```
## [1] "Hi, how are you doing!"     "I'm doing well, HBY!"
## [3] "Me too, thanks for asking!"
```

```
names <- c("Inger", "Peter", "Kalle", "Ingrid")

str_c("Hi ", names, ', ', "I hope you're doing well. As per this letter, I invite you to my birthday pa
```

Concatenating strings

```
## [1] "Hi Inger, I hope you're doing well. As per this letter, I invite you to my birthday party."
## [2] "Hi Peter, I hope you're doing well. As per this letter, I invite you to my birthday party."
## [3] "Hi Kalle, I hope you're doing well. As per this letter, I invite you to my birthday party."
## [4] "Hi Ingrid, I hope you're doing well. As per this letter, I invite you to my birthday party."
```

```
names <- c("Inger", "Peter", "Kalle", "Ingrid")

paste("Hi", names, ',' ,"I hope you're doing well. As per this letter, I invite you to my birthday party
```

```
## [1] "Hi Inger , I hope you're doing well. As per this letter, I invite you to my birthday party."
## [2] "Hi Peter , I hope you're doing well. As per this letter, I invite you to my birthday party."
## [3] "Hi Kalle , I hope you're doing well. As per this letter, I invite you to my birthday party."
## [4] "Hi Ingrid , I hope you're doing well. As per this letter, I invite you to my birthday party."
```

Not looking good!

```
names <- c("Inger", "Peter", "Kalle", "Ingrid")

str_c("Hi ", names,  ', ',  "I hope you're doing well. As per this letter, I invite you to my birthday p
```

```
## [1] "Hi Inger, I hope you're doing well. As per this letter, I invite you to my birthday party."
## [2] "Hi Peter, I hope you're doing well. As per this letter, I invite you to my birthday party."
## [3] "Hi Kalle, I hope you're doing well. As per this letter, I invite you to my birthday party."
## [4] "Hi Ingrid, I hope you're doing well. As per this letter, I invite you to my birthday party."
```

```
unnecessary_whitespaces <- c("    on the left", "on the right    ", "    on both sides   ", "   literall
unnecessary_whitespaces
```

Removing unnecessary whitespaces

```
## [1] "    on the left"             "on the right    "
## [2] "    on both sides   "        "   literally    everywhere  "
```

```
str_trim(unnecessary_whitespaces, side = "left")
```

```
## [1] "on the left"              "on the right    "
## [2] "on both sides   "         "literally    everywhere  "
```

```r
str_trim(unnecessary_whitespaces, side = "both") # the default option
```

```
## [1] "on the left"             "on the right"
## [3] "on both sides"           "literally    everywhere"
```

Not fixing at middle

```r
str_squish(unnecessary_whitespaces)
```

```
## [1] "on the left"          "on the right"         "on both sides"
## [4] "literally everywhere"
```

```r
five_largest_cities <- c("Stockholm", "Göteborg", "Malmö", "Uppsala", "Västerås")
str_view(five_largest_cities, "Stock", match = TRUE) #, html = TRUE)
```

Highlighted view

```
## [1] | <Stock>holm
```

```r
str_view(five_largest_cities, pattern = "borg")
```

```
## [2] | Göte<borg>
```

Extract certain words or values based on what comes before or after them

- List all the numbers that appear before "m."

```r
heights <- c("1m30cm", "2m01cm", "3m10cm")
str_view(heights, "[0-9]+(?=m)")
```

```
## [1] | <1>m30cm
## [2] | <2>m01cm
## [3] | <3>m10cm
```

- List all the numbers that appear after "m."

```r
str_view(heights, "[0-9]+(?!m)") # after m
```

```
## [1] | 1m<30>cm
## [2] | 2m<01>cm
## [3] | 3m<10>cm
```

Patterns Let's look at sentences dataset.

- pattern to be present in the beginning ^ or at the end $ of a string.

```
first_10_sentences = sentences[1:10]
str_view(first_10_sentences, "^The")
```

```
## [1] | <The> birch canoe slid on the smooth planks.
## [4] | <The>se days a chicken leg is a rare dish.
## [6] | <The> juice of lemons makes fine punch.
## [7] | <The> box was thrown beside the parked truck.
## [8] | <The> hogs were fed chopped corn and garbage.
```

- Find the sentences start with the and end with full stop (.)

```
temp_string = str_detect(first_10_sentences, "^The.+\\.$")
temp_string
```

```
##  [1]  TRUE FALSE FALSE  TRUE FALSE  TRUE  TRUE  TRUE FALSE FALSE
```

```
str_view(first_10_sentences, "^The.+\\.$")
```

```
## [1] | <The birch canoe slid on the smooth planks.>
## [4] | <These days a chicken leg is a rare dish.>
## [6] | <The juice of lemons makes fine punch.>
## [7] | <The box was thrown beside the parked truck.>
## [8] | <The hogs were fed chopped corn and garbage.>
```

```

str_replace(heights, "m", "meters")
```

Replace string

```
## [1] "1meters30cm" "2meters01cm" "3meters10cm"
```

More advanced string manipulation

- Detect matches

```
first_10_sentences
```

```
##  [1] "The birch canoe slid on the smooth planks."
##  [2] "Glue the sheet to the dark blue background."
##  [3] "It's easy to tell the depth of a well."
##  [4] "These days a chicken leg is a rare dish."
##  [5] "Rice is often served in round bowls."
##  [6] "The juice of lemons makes fine punch."
##  [7] "The box was thrown beside the parked truck."
##  [8] "The hogs were fed chopped corn and garbage."
##  [9] "Four hours of steady work faced us."
## [10] "A large size in stockings is hard to sell."
```

- Let's count number of 'the' in a document

```r
sum(str_count(str_to_lower(first_10_sentences), regex("the")))
```

```
## [1] 10
```

- The word 'these' also counted
- Let's try using boundary, '\b...\b' try to find the exact word between the boundries.

```r
sum(str_count(str_to_lower(first_10_sentences), regex("\\bthe\\b")))
```

```
## [1] 9
```

- Let's find how many sentences has the word 'the'

```r
sum(str_detect(str_to_lower(first_10_sentences), regex("\\bthe\\b")))
```

```
## [1] 6
```

For more details see **stringr manual** [https://cran.r-project.org/web/packages/stringr/stringr.pdf].

Application on dataset of Boston 311 Service request in 2023

```r
Boston311_2023_data = read.csv("https://data.boston.gov/dataset/8048697b-ad64-4bfc-b090-ee00169f2323/res
str(Boston311_2023_data)
```

```

Exercises

1. How many recorded complaints are in the data set?

```
library(dplyr)
cat("Number of recorded complaints are:",length(Boston311_2023_data$case_title))
```

```
## Number of recorded complaints are: 242693
```

2. What fraction of calls in this data set deal with traffic? A complaint is considered to deal with traffic if it has the word "traffic" present in the value of the "case_title" column?

```
library(stringr)
head(Boston311_2023_data$case_title)
```

```
## [1] "Requests for Street Cleaning"
## [2] "Ground Maintenance: --Not in list-- - BPRD"
## [3] "Request for Pothole Repair"
## [4] "Tree Maintenance Requests"
## [5] "Parking Enforcement"
## [6] "Sign Repair"
```

```
traffic_related_complaints_status <- str_detect(str_to_lower(Boston311_2023_data$case_title), regex("\\
print(sum(traffic_related_complaints_status))
```

```
## [1] 3454
```

```
cat("proprotion of traffic related complains:", sum(traffic_related_complaints_status)/length(Boston311_
```

```
## proprotion of traffic related complains: 0.01423197
```

3. Which neighborhood has maximum number of complaints of type "Parking Enforcement"?

```
Boston311_2023_data$Parking_Enforcement_status <- str_detect(Boston311_2023_data$case_title, regex("\\bl
```

```
Parking_Enforcement_by_nbd <- Boston311_2023_data %>%
  group_by(neighborhood) %>%
  summarise(nbd_count_Parking_Enforcement = sum(Parking_Enforcement_status)) %>%
  arrange(desc(nbd_count_Parking_Enforcement))
head(Parking_Enforcement_by_nbd, 10)
```

```
## # A tibble: 10 x 2
##    neighborhood                          nbd_count_Parking_Enforcement
##    <chr>                                                         <int>
##  1 South Boston / South Boston Waterfront                         6812
##  2 East Boston                                                    5845
##  3 Dorchester                                                     5091
##  4 Allston / Brighton                                             3203
##  5 South End                                                      3135
##  6 Downtown / Financial District                                  2537
##  7 Roxbury                                                        2352
##  8 Jamaica Plain                                                  2068
##  9 Charlestown                                                    1968
## 10 Boston                                                         1894
```

4. Each call is assigned a police district. The date of the call is in column "open_dt" and the assigned police district is in column "police_district".

a. Compute how many calls are assigned to each police district every month.
b. Compute how many calls are assigned to each police district on average.
c. Compute how many calls are assigned to each month on average.
d. What is the median of this monthly number of calls per police district?

- Let's find unique police districts in the dataset

```
unique(Boston311_2023_data$police_district)
```

```
##  [1] "B3"  "E5"  "C6"  "E18" "D4"  "A1"  "D14" "A15" "C11" "A7"  "E13" "B2"
## [13] ""    " "
```

- Let's check the open date using variable 'open_dt'

```
class(Boston311_2023_data$open_dt)
```

```
## [1] "character"
```

```
head(Boston311_2023_data$open_dt)
```

```
## [1] "2023-01-01 00:07:00" "2023-01-01 00:28:00" "2023-01-01 00:33:08"
## [4] "2023-01-01 00:37:21" "2023-01-01 00:37:35" "2023-01-01 00:39:00"
```

```
library(lubridate)
class(ymd_hms(Boston311_2023_data$open_dt))
```

```
## [1] "POSIXct" "POSIXt"
```

```
head(ymd_hms(Boston311_2023_data$open_dt))
```

```
## [1] "2023-01-01 00:07:00 UTC" "2023-01-01 00:28:00 UTC"
